The Second Global COVID-19 Summit generated new funding for ACT-A, giving the vaccines pillar a substantial boost – now 37% of goal reached – but still leaving the other three pillars severely underfunded (under 10% of goals met for each pillar). The new pandemic preparedness and global health security financial intermediary fund (FIF) received funding commitments from several G20 countries, but the total raised is still less than 10% of the annual goal. Canada was the first country to pledge the full amount of their “fair share ask” for the ACT Accelerator (USD 616 million). (This will be reflected in the ACT-A funding data once the funding agreement is finalized.) Some encouraging improvements in vaccination coverage:

- Senegal reports that 75% of their 60+ population has received a full initial course of COVID-19 vaccines, up from 34% two weeks ago.
- Zambia reports a daily vaccination rate of 0.39% of the population, up from 0.04% two weeks ago (28-day average).

COVID Global Accountability Platform’s (COVID GAP’s) Accountability Reports highlight and analyze recent developments, track progress toward national, regional, and global targets, and identify high-priority recommendations for a more effective, efficient, and equitable pandemic response and preparedness. Drawing on data across many sources, our team tracks important measures of progress on commitments and remaining gaps, helping to hold leaders and organizations to account on these actions.

Takeaways from Second Global COVID-19 Summit

The Second Global COVID-19 Summit brought renewed attention to the global COVID-19 crisis and spurred new pledges and commitments from governments and organizations around the world. More than $3 billion in new financial commitments were pledged at the Summit, including about $2.7 from governments and about $700 million from the private sector. Of this new funding, $2.5 billion is dedicated toward COVID-19 response activities and $712 million toward a new pandemic preparedness and global health security financial intermediary fund (FIF) at the World Bank.
New Summit financial pledges from governments

New Pledges (USD) Total: 2,762,470,000

- EU: 871,400,000
- New Zealand: 6,470,000
- Australia: 320,500,000
- Germany: 52,700,000
- Italy: 210,700,000
- USA: 200,000,000
- France: 231,800,000
- Belgium: 15,800,000
- Denmark: 10,600,000
- Japan: 30,000,000
- UAE: 10,000,000
- Canada: 394,000,000
- Spain: 107,000,000
- South Korea: 300,000,000
- Taiwan: 1,500,000

Test & Treat: 111,870,000
Pandemic Preparedness: 1,174,700,000
Vaccines & Vaccinations: 663,400,000
Unknown: 812,500,000

Source: White House Statement: 2nd Global COVID-19 Summit Commitments and COVID GAP Analysis
The Summit also generated other commitments from countries and organizations, including new efforts to implement “test-and-treat” strategies.

| U.S., Global Fund, Unitaid, and other ACT-A partners | Announced launch of over $120 million in support to countries for “test-and-treat” strategies for the most vulnerable populations in LMICs  

- $80 million from Global Fund  
- $22 million from Unitaid  
- $20 million of American Rescue Plan funds that USAID plans to use to scale up test-and-treat in up to eight countries |
| CHAI                                | Announced agreements with leading generic manufacturers to make generic nirmatrelvir/ritonavir available at under US$25 per treatment course and dedicate capacity for 4.5 million treatment courses per month for LMICs |

Many low- and middle-income countries also reaffirmed commitments to reach nationally set vaccination targets and to build capacity to support vaccination and other COVID-19 response efforts. Notably, Senegal committed to supporting the facilitation of a new $200 million Madiba (Manufacturing in Africa for Disease Immunization and Building Autonomy) biotechnology platform which will include production of vaccines against COVID-19 by mobilizing financing of $91 million and making a 3.3 hectares site available.

There were also a few additional vaccine donation pledges made by countries including Italy, South Africa, Sweden, and Thailand. Other countries made additional commitments of support for COVID-19 response and pandemic preparedness efforts, but most are not concrete enough to be tracked. A number of commitments came from the private sector as well, including from Merck, Pfizer, Abbott, Black Rock Foundation, Mastercard Foundation, and UPS Foundation to support various aspects of the COVID-19 response including vaccinations, testing, and access to treatments. A full list of commitments can be found [here](#) and our take on the results of the Summit are [here](#).
Holding Leaders to Account

In the accountability reports, we present real-time analysis and track updates in the dynamic landscape of the global response to COVID-19 across five areas:

1. Funding the Global Response
2. Vaccines and Vaccinations
3. Test and treat
4. Oxygen
5. Pandemic preparedness and health system resilience

Interactive versions of the charts and graphs below are available at https://covid19gap.org/view-the-data. The data visualizations will be updated every two weeks and new metrics will be added over time, as data allow. We welcome feedback and direct engagement to identify and incorporate additional data sources and/or relevant metrics to track.

### 1. Funding the Global Response

The ACT-Accelerator, the major global multi-lateral initiative coordinating pandemic response, has requested $16.8 billion in grant funding to support activities from October 2021 to September 2022. Halfway through its budget year, ACT-A has raised $3.35 billion, a fraction of the funding needed to implement its strategy. At 37% funded, the vaccines pillar fares best ($2.2 billion), while $34 million has been allocated to the diagnostics pillar, less than 1% of the target funding. The persistent lack of funding may be indicative of waning support among wealthier countries for the “no one is safe until everyone is safe” approach.

**Figure 1. Donor country funding committed versus requested for ACT-A (2021-2022)**

Source: WHO, updated May 18, 2022

NOTE: These funding targets (tracked at the source listed above) are set for donor countries and differ from those in the ACT-A Strategic Plan, which include expected contributions from development banks and self-funding middle-income countries.
In February 2022, the ACT-Accelerator Facilitation Council’s Finance and Resource Mobilization Working Group, chaired by Norway, set out a “fair share” framework to set contribution benchmarks by country. The calculation of the fair share benchmarks is based on the size of national economies and likely gains from a faster recovery of the global economy and trade.

Several countries made new financial pledges to ACT-A during the Second Global COVID-19 Summit, which are not yet reflected as finalized financial agreements in the ACT-A funding data displayed in Figures 2.1 and 2.2. Canada is the first country to pledge their “fair share ask” for the 2021-2022 budget year (not yet reflected in the ACT-A data), though Germany is also close at 70%.

**Figure 2.1. ACT-A “fair share” ask versus contribution by country (2021-2022): G20 countries**

**Figure 2.2 ACT-A “fair share” ask versus contribution by country (2021-2022): European Union countries**

Source: WHO, updated May 18, 2022
While ACT-A provides a coordination and facilitation mechanism, each organization still fund-raises separately. Recent fundraising and replenishment events directly and indirectly related to global COVID response have also fallen short of funding targets. The table below shows results from recent fund-raising events as well as pending fund-raising targets in the near future.

<tr>
<td><strong>Gavi</strong></td>
<td>In April 2022, Germany, Indonesia, Senegal, and Ghana co-hosted the Break COVID Now Summit to raise funds for Gavi COVAX Advance Market Commitment (AMC). Of the $5.2 billion ask to support purchase and delivery of vaccines and in-country capacity support for vaccinations, up to $4.8 billion has so far been committed, of which $1.7 billion is from donor countries. Up to $2.1 billion is committed by financing facilities, which will “front-load” financing, and another $1 billion will be provided by multilateral development banks.</td>
</tr>
</tbody>
</table>

### 2. Vaccines and Vaccinations

**Vaccination Targets: Prioritize Sub-Populations**

The rapid development of safe and effective vaccines for COVID-19 was an immense scientific accomplishment. The scale and speed of the roll out of vaccines is also unmatched, though flawed and inequitable.

Support is needed to improve in-country storage, transport, and delivery of vaccines. However, funding for this effort has slowed over the past year and the ACT-A vaccinations pillar has only a fraction of the funding requested, seven months into their fiscal year.

Global entities such as the WHO set ambitious targets for vaccinating the world. Unfortunately, many countries missed the global 10% coverage target (September 2021) and the 40% target (December 2021) and it is widely acknowledged that around 100 countries will miss the 70% target (June 2022).

Many countries have set their own national targets for population coverage, which range from 20% to 95% with varying timescales, but few have met the targets yet (Figure 3). Despite falling short of the targets, progress is being made and vaccinations are steadily increasing in many of these countries (see Figure 5 for vaccine rates in the 34 COVAX priority countries; data on all countries is available on the COVID GAP website).
Figure 3. Country-set vaccination coverage targets versus current coverage (for COVAX Advance Market Commitment countries only)

Source: WHO CRD, data updated May 19, 2022
Note: Gold bars denote country-set coverage targets. Some countries are shown at >100% because of the administration of booster doses.
In the face of Omicron and its sub-variants, COVID-19 vaccines have successfully reduced hospitalization and death, even while infection rates remain high among vaccinated populations. Given this context, as we note in The Path Forward report, prioritization for full vaccination, including boosters, should be given to the highest-risk populations, including people over the age of 60, people with comorbidities and suppressed immune systems, and health care workers.

We are able to track vaccination coverage for ages 60+ and for health care workers in many COVAX Advance Market Commitment (AMC) countries (see Figure 4 below) but have not yet found public data on coverage among populations with comorbidities or suppressed immune systems. Such information will be important to track over time to follow progress toward high-priority goals.

In the past two weeks, Senegal reported significant improvement in coverage of the 60+ population, with an increase from 34% to 75% who have received a full initial course of COVID-19 vaccination.

**Figure 4. Vaccination coverage by sub-population (60+ and health care workers) for COVAX concerted support countries**

Source: [WHO CRD](https://www.who.int), data updated May 19, 2022
Challenges to Reaching Coverage Goals

Vaccine supply on a global level has greatly improved over the past year and is no longer the critical limiting factor in 2022. However, supply remains an issue at the local level, particularly for low- and lower-middle income countries in Africa, Eastern Mediterranean, and South-East Asia regions (see interactive visuals on the COVID GAP website to filter country vaccination data by region and income).

For many countries, the primary challenge has shifted from lack of supply to capacity to utilize available supply before product expiration. Daily vaccination rates in many countries remain low. According to Our World In Data, only 12.5% of people living in low-income countries have received a full course of COVID-19 vaccination, compared with 75% in high-income countries (as of May 9, 2022). Low- and lower-middle-income countries report significant challenges to vaccination, including lack of sufficient cold storage and transport, shortage of health care workers, vaccine misinformation, and competing health priorities.

Several countries included in the COVAX concerted support category (those countries deemed to be most in need of support to increase vaccination coverage) reported modest gains in daily vaccination rates over the past two weeks, including Burkina Faso, Ghana, Nigeria, Sierra Leone, and the Solomon Islands. Zambia reported the most substantial increase, with a daily vaccination rate of 0.39% of the population, up from 0.04% two weeks ago (28 day average).

Figure 5. Average daily vaccination rate, product utilization, and supply challenges for COVAX concerted support countries

Source: WHO CRD, data updated May 19, 2022
Support is needed to improve in-country storage, transport, and delivery of vaccines. However, funding for this effort has slowed over the past year and the ACT-A vaccinations pillar has only a fraction of the funding requested, seven months into their fiscal year.

**Vaccine Donations**

Vaccine donations were a significant aspect of the supply landscape in 2021 but unfortunately deliveries were concentrated at the end of the year, overwhelming recipient countries. In addition, many of the doses donated bilaterally and through COVAX were delivered too close to their expiration dates for recipient countries to use, leading to wastage. In December 2021, recipient countries refused more than 100 million donated doses, primarily because of the short timeframe before expiry and also in some cases because storage facilities were full.

**Figure 7. Pledged versus shipped vaccine donations, by top ten donor countries**

![Chart showing pledged and shipped doses by country]

Source: Duke Global Health Innovation Center, updated May 23, 2022
Many countries, including the United States, the United Kingdom, Canada, and Australia, still have a long way to go to fulfill their donation pledges in 2022 but this needs to be done in concert with recipient countries and multilateral organizations like the African Union’s African Vaccines Acquisition Trust (AVAT), so that deliveries can be planned, anticipated, and matched to capacity.

### 3. Test & Treat

Test-and-treat strategies will be essential for the roll out of oral therapeutics to treat COVID-19. This will depend on global access to reliable diagnostics, particularly rapid tests. However, availability of diagnostics remains very low in low- and middle-income countries. Nearly all low- and lower-middle-income countries remain far below the ACT-A target of 1 test per 1,000 people per day.

**Figure 8.1. Average number of daily tests per 1,000 people from January 1 to May 22, 2022**

![Average number of daily tests per 1,000 people from January 1 to May 22, 2022](source: FIND, updated May 24, 2022)

*Note: Data shown by country, WHO region, and income category. The ACT-A target of 1 test per 1,000 people per day is shown with dotted line. Average number of daily tests includes antigen and PCR tests.*
The average daily testing rate rose steeply for high-income countries in 2021, rising above the 1 test per 1,000 people target in July 2020 and peaking at more than 11 per 1,000 in January 2022. Testing rates for middle-income countries remained far lower, seldom reaching the 1 per 1,000 target. For low-income countries, the line from 2020 to present is essentially flat, with testing rates that have rarely risen to even 0.1 in 1,000.

This area of pandemic response has received far less global attention than vaccines. The ACT-A diagnostics pillar has raised less than 1% of the funding target, while the therapeutics pillar (which includes oxygen as a treatment) has raised just over 4%.
The supply of oral therapeutics for the treatment of COVID-19 is expected to be limited in 2022. Despite broad licensing to generic manufacturers through the Medicines Patent Pool, generic production is unlikely to make a meaningful contribution to supply this year and manufacturing capacity will be largely limited to that of the originator companies, Merck and Pfizer. Merck expects to produce 30 million courses by the end of 2022 and Pfizer expects to produce 120 million courses.

Purchases for both drugs began even before the first regulatory authorizations were received. Pfizer’s drug Paxlovid (nirmatrelvir/ritonavir) demonstrated strong efficacy data in Phase 3 clinical trials and therefore has been in greater demand. Almost the entire available supply of Paxlovid for the first half of the year has been purchased but there is still significant supply available later in 2022.

Figure 10. Oral therapeutic manufacturing projections for 2022 and confirmed purchases

Legend
- Courses Purchased
- Projected manufacturing by the end of 2022

Source: COVID GAP analysis, updated May 23, 2022
Similar to what we saw with vaccines, the majority of the purchases for oral therapeutics to date have been placed by high-income countries, with no purchases by low-income countries.

Global Fund has signed a letter of intent with Pfizer for the procurement of up to 6 million treatment courses of Paxlovid (nirmatrelvir/ritonavir). This will make the treatment available to all 130 countries eligible for Global Fund grants, subject to local regulatory approval and authorization. This builds on Global Fund and other partners’ announcement at the Second Global Summit to support test-and-treat programs in over 20 LMICs.

UNICEF has announced a supply agreement with Pfizer for 4 million courses of Paxlovid, dependent on “country demand, clinical recommendations, and necessary approvals.” Pricing information is not publicly available. Merck has also allocated 3 million courses of molnupiravir to UNICEF throughout the first half of 2022 “for distribution in more than 100 low- and middle-income countries following regulatory authorizations.” At the Summit, Merck committed to make another 2 million courses available to USAID at the company’s “best access price.”

Figure 11. Oral therapeutics purchases by country income category

Source: COVID GAP analysis, updated May 23, 2022
Both Merck and Pfizer have licensed their oral therapeutics to 35 manufacturers each. All licenses from Pfizer are through the Medicines Patent Pool (MPP), while Merck has issued eight direct voluntary licenses to generic manufacturers in India in addition to 27 sublicenses via the MPP.

Figure 12. Licensed generic manufacturers for COVID-19 oral therapeutics

![Map showing licensed manufacturers for COVID-19 oral therapeutics](source)

Figure 13. Number of licensed manufacturers by country and drug

![Bar chart showing number of manufacturers by country and drug](source)

Source: COVID GAP analysis, updated May 24, 2022
The licenses through the MPP cover only a subset of countries for distribution. Merck’s deal covers 105 low- and middle-income countries and Pfizer’s deal covers 95 low- and middle-income countries. Both licensing deals left out some notable upper-middle income countries, shown in yellow in the map below.

**Figure 14. Country inclusion in the MPP sublicenses for distribution**

In the absence of significant purchases, generic manufacturers are unlikely to ramp up production. This uncertain demand may in part be linked to the lack of test-and-treat capacity globally. Without an effective way to distribute the treatment, countries are unlikely to spend limited resources on oral therapeutics. Existing test-and-treat strategies built by the Global Fund, PEPFAR, and the US President’s Malaria Initiative (PMI) to address malaria, HIV/AIDS and other infectious diseases provide instructive examples and could be leveraged to increase access to COVID treatments. For more analysis and recommendations on how to improve access to oral therapeutics for COVID, see our recent report [Pills to People](#).
4. OXYGEN

Oxygen, currently the most frequently used treatment for COVID-19, is included in the ACT-A therapeutics pillar. ACT-A 2022 targets for oxygen include the supply of essential medical oxygen to 6 to 8 million severe and critical patients by September 2022. However, reports of oxygen shortages continue.

PATH provides estimates of COVID-19 oxygen needs for LMICs (which can be viewed by country and income group) based on the number of confirmed COVID cases and assumptions about how many of those cases will require oxygen. The tracker does not include data on available supply or shortages within LMICs.

As the February 2022 African Union Statement on Access to Medical Oxygen notes, supply of oxygen cylinders and ventilators is not the only issue. Barriers to oxygen access in many LMICs include lack of spare parts to repair equipment, insufficient piping and storage infrastructure, and a lack of financing to implement national oxygen plans and create oxygen systems so countries can meet their own oxygen supply needs.

Recent funding updates:
- Of the $3.5 billion requested by ACT-A for the therapeutics pillar (which includes $2.5 billion expected to come from donor countries, as tracked in this report), $1.4 billion is requested to support oxygen supplies in 2022.
- Unitaid, which chairs the ACT-A Oxygen Emergency Taskforce, recently announced a $56 million contribution to increase access to medical oxygen but the pillar has been largely unfunded by donor countries.
- The US Government committed $75 million in December 2021 to USAID’s Rapid Response Surge Support effort, which included oxygen production and delivery.

Overall, there is very little public data available on real-time oxygen needs (including actual supply, demand, and shortages). This remains an important gap in the data.

5. PANDEMIC PREPAREDNESS AND HEALTH SYSTEM RESILIENCE

As we note in the Path Forward report, the pandemic response over the past two years has forced countries to redistribute resources away from other pressing health needs. Health systems around the world need increased support to improve primary care provision and resilience, which will help to address the backlog of urgent non-COVID needs and better prepare for additional COVID outbreaks as well as future epidemics. Specific capabilities such as surveillance and robust supply chains will enable improvements in future pandemic preparedness as well as other health system needs.
However, there has been little concrete action toward building health system resilience globally. The ACT-A pillar focused on strengthening health systems, including national preparedness and response plans, is seriously underfunded.

**Figure 15. Proportion of $3.65 billion ACT-A health systems and response budget that is currently funded**

Some steps are being taken to prepare the world for the next pandemic. The [G20 has proposed](https://www.g20.org/en/) a financial intermediary fund (FIF) for pandemic prevention, preparedness, and response housed at the [World Bank](https://www.worldbank.org/). At the Second Global COVID-19 Summit, countries pledged new commitments to the FIF. In addition to the U.S.’s previous pledge of $250 million, there was an addition $712 million pledged to the FIF from the U.S., Germany, and EU. This is a promising start, but the projected need for the fund is $10.5 billion per year over the next five years for investments to strengthen the capacity of low- and middle-income countries.

**Figure 16. Government contributions to the Financial Intermediary Fund (FIF) toward the 2022 goal**

CEPI has launched the [100 Days Mission](https://www.cepii.org/100DaysMission/), an effort to ensure that safe, effective, and affordable vaccines can be developed and deployed within 100 days of the discovery of a new pathogen threat. This strategy includes global surveillance systems, point-of-care testing capacity worldwide, and expanded global manufacturing capacity at the ready to ensure that new vaccines can be equitably distributed.

However, fundraising for this effort is off to a slow start, with about $1.5 billion raised, less than half of the $3.5 billion target.
As part of WHO’s technology transfer hub, Afrigen Biologics in South Africa developed its own version of Moderna’s mRNA vaccine, using the publicly available sequence. Afrigen plans to share this with other LMIC manufacturers but production at scale is not likely before the end of 2023.

The Partnership for African Vaccine Manufacturing released a framework, detailing a plan to build sustainable vaccine development and manufacturing capacity across Africa to prioritize 22 diseases. This effort is expected to cost $30 billion over 20 years.

Moderna and BioNTech have committed to establishing manufacturing capacity in Africa. Moderna will develop an mRNA facility in Kenya with assistance from the US government. This facility is expected to produce drug substance for up to 500 million doses of vaccine each year for use across Africa. BioNTech plans to launch modular factories called “Biontainers” to manufacture mRNA vaccines in Rwanda, Senegal, and possibly South Africa.

These and future investments in LMIC manufacturing will need to also focus on developing the supportive ecosystem that can support sustainable capacity. This includes ensuring demand (as demonstrated by the lack of orders for vaccines made in South Africa’s Aspen Pharmaceuticals), a trained workforce, robust regulatory pathways, and financial models that address the challenge of keeping extra capacity at the ready for future health crises.
